Swiggy Sales Analysis

Insights Report | Food-delivery performance, Jan – Aug 2025

Prepared by Abhishek Gupta • Tool: Microsoft Excel (Pivot Tables, Slicers) • 197,430 order records • 243 days • 28 states

₹53.01M	197.43K	₹268.51	4.34 ★	5.59M
Total sales	Total orders	Avg order value	Avg rating	Rating count

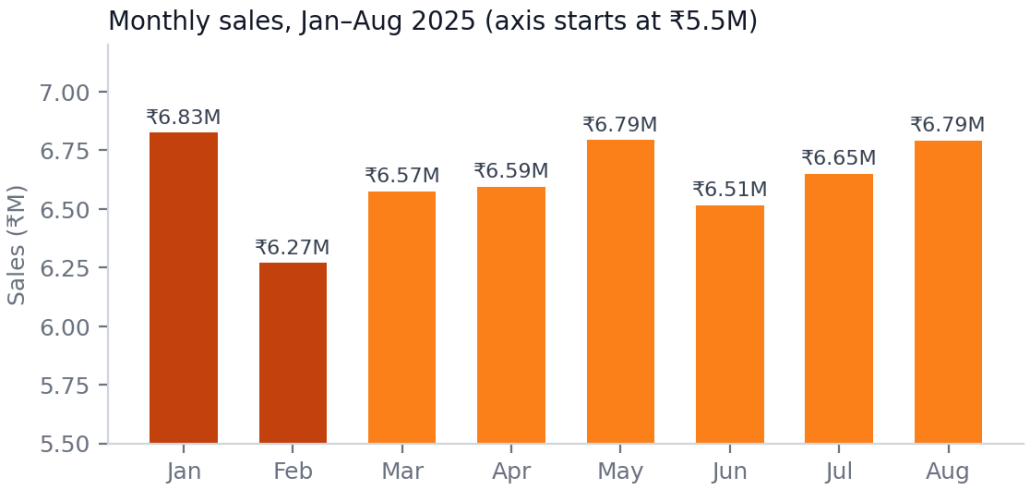

Executive summary

- **Demand is steady, not seasonal.** Sales average ₹218K a day. Monthly totals sit between ₹6.27M and ₹6.83M, and once month length is accounted for, daily averages vary by under 6%.
- **Veg drives volume, Non-Veg drives value.** Veg is 71% of orders and 65% of sales; a Non-Veg order is worth ₹324 vs ₹246 for Veg (+32%).
- **Bengaluru leads because of volume, not basket size.** It records about 20K orders, roughly 4× the typical state (median ≈5K), while its average order (₹272) is close to the national average. Goa and Uttar Pradesh have the highest AOV (about ₹306).
- **A handful of chains carry a quarter of sales.** The top 5 restaurants out of 993 contribute 25.4% of sales; KFC leads with ₹4.25M and an AOV of ₹328.
- **Weekday effects are small.** Saturday is the best day (₹222K per day) and Wednesday the weakest (₹215K), a gap of just 3%.
- **Customer satisfaction is stable.** Rating is 4.3 in every quarter and similar for Veg (4.35) and Non-Veg (4.32).
- **Data check:** Q3 holds only July–August, and 22 Feb 2025 has about double the normal orders (see page 5).

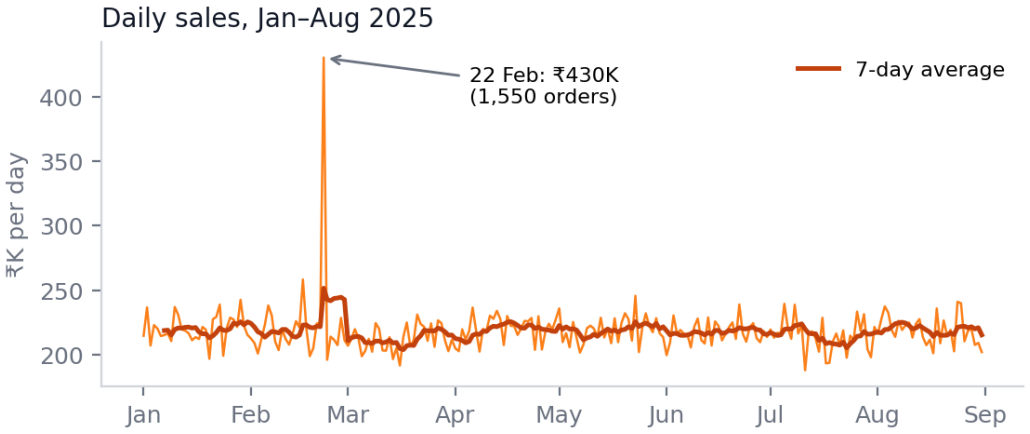

Dashboard preview

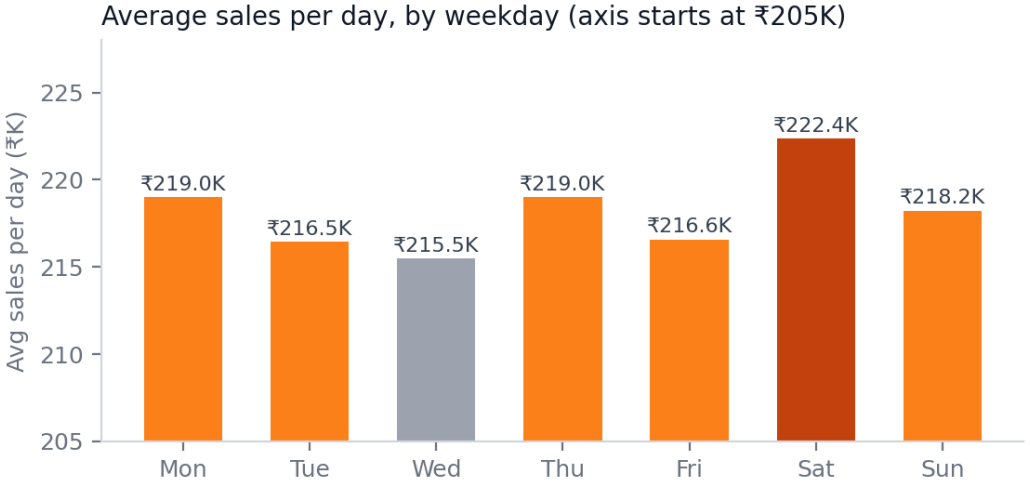

1. Sales over time

Reading the chart: February looks like the weakest month (₹6.27M) only because it has 28 days. Per day, February is actually the **strongest** month (₹223.9K), and March the weakest (₹212.0K). January is the biggest month in total (₹6.83M) simply because it has 31 days and a strong start.

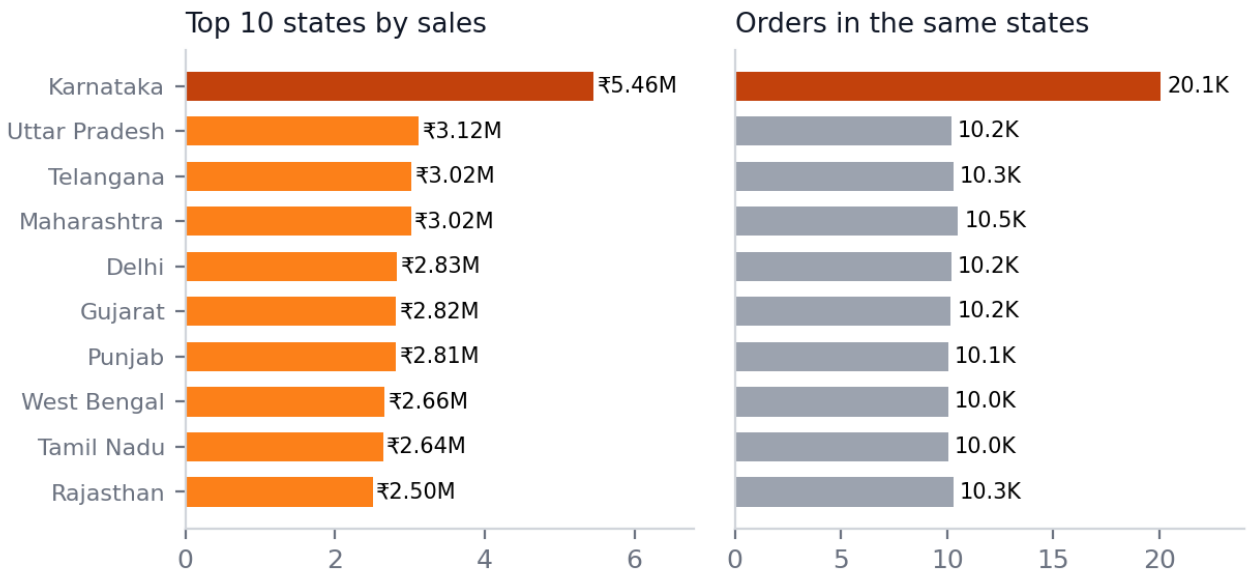

Outlier: 22 Feb 2025 recorded ₹430K from 1,550 orders, nearly double the neighbouring days (about 800 orders). More than half of that day (₹232K) came from Bengaluru. It looks like a data-collection spike rather than genuine demand, so treat it with care when quoting February or peak-day figures.

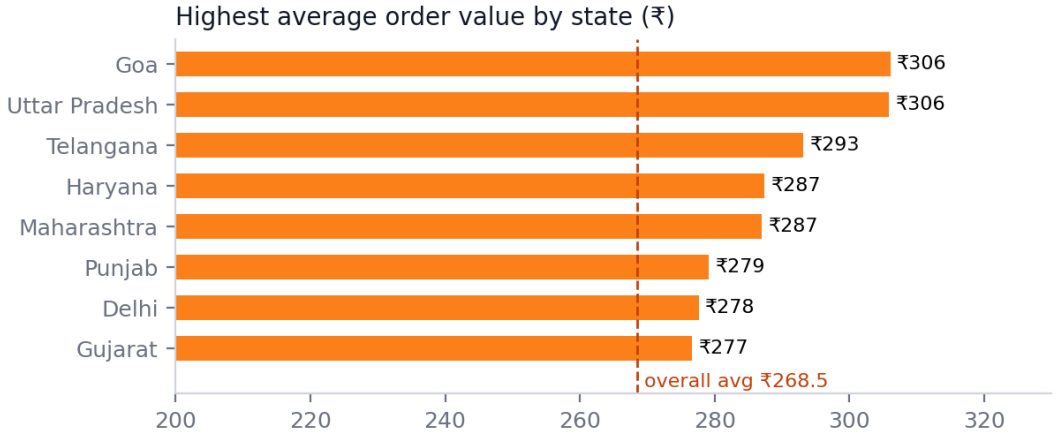

Why per-day averages? The period has 35 Wednesdays to Sundays but only 34 Mondays and Tuesdays, so raw weekday totals favour the days that occur more often. Averaging per day removes that bias: Saturday leads (₹222.4K), and Tuesday is no longer the weakest day (Wednesday is, at ₹215.5K). The spread between best and worst day is only about 3%, so weekday-specific promotions are unlikely to move the needle much.

2. Geography: where sales come from

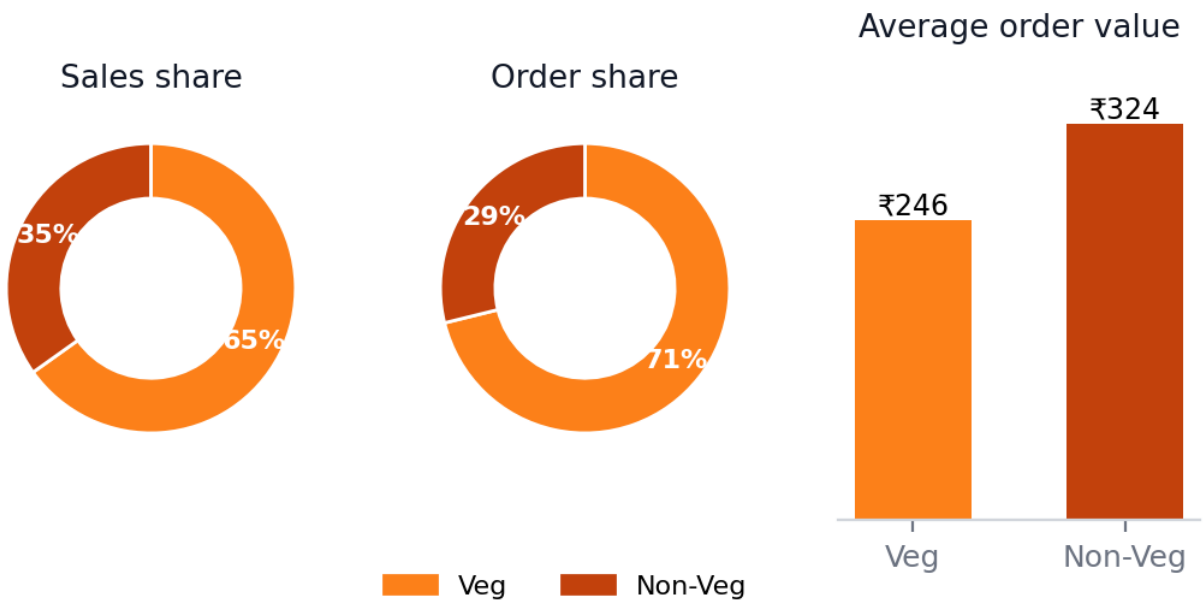

Top 5 cities = 32.9% of sales. Bengaluru (₹5.46M, 10.3%), Lucknow (₹3.12M), Hyderabad (₹3.02M), Mumbai (₹3.02M) and New Delhi (₹2.83M). Because each state maps to one city in this dataset, state and city rankings are identical.

Important context: Order counts per state fall into near-fixed tiers (about 5K, 10K, and 20K for Karnataka). That suggests the dataset was sampled per city, so total sales mainly reflect how many records each city contributed. **Average order value (AOV)** is the fairer way to compare markets.

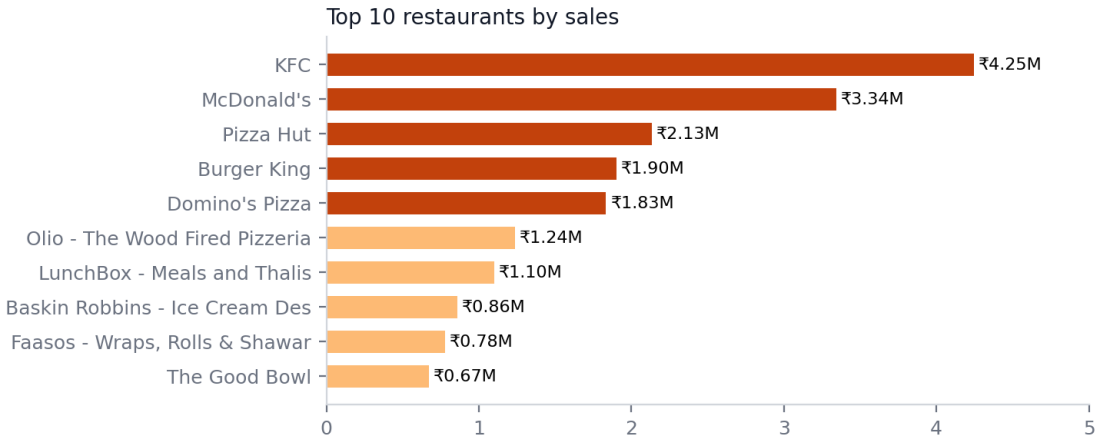

Goa (₹306) and Uttar Pradesh (₹306) have the highest-value baskets, followed by Telangana (₹293). At the other end, Tripura (₹229), Jharkhand (₹235) and Odisha (₹238) have the lowest. Goa is the notable case: a high AOV from a small order base, which makes it a good candidate for growth through promotions. The smallest markets by sales are Gangtok (₹0.56M), Kohima (₹0.58M) and Aizawl (₹0.82M).

3. What customers order

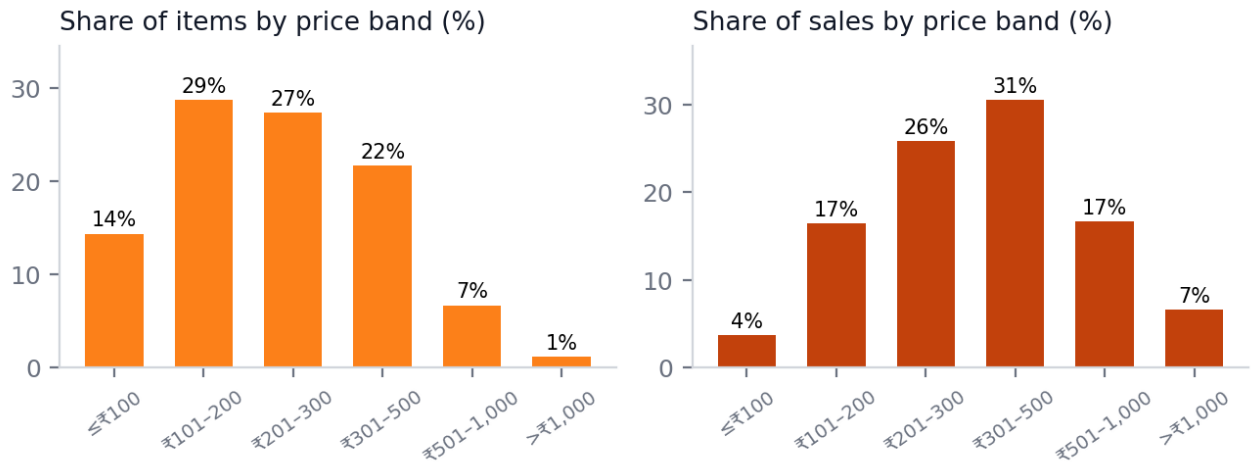

Veg dishes make up **140,482 orders (71%)** and **₹34.5M (65%)** of sales. Non-Veg dishes are fewer (56,948 orders, 29%) but cost more on average, so they punch above their weight at **35% of sales**. Ratings are almost identical (Veg 4.35, Non-Veg 4.32), so quality is not a differentiator between the two.

Restaurant	Sales	Orders	AOV
KFC	₹4.25M	12,961	₹328
McDonald's	₹3.34M	13,530	₹247
Pizza Hut	₹2.13M	6,529	₹327
Burger King	₹1.90M	7,116	₹267
Domino's Pizza	₹1.83M	5,492	₹334

Takeaway: McDonald's and KFC receive a similar number of orders, but KFC earns about ₹0.9M more because its basket is 33% larger. Chains also dominate the "Recommended" category (₹7.19M, 13.6% of all sales), which shows how strongly menu placement drives purchases.

4. Price bands

Most items are priced ₹100–₹300 (about 56% of items). Orders above ₹500 are only 7.9% of items but generate **23.4% of sales**, so a small premium segment (family combos, party packs, large thalis) carries a lot of revenue.

5. Data notes and limitations

- **Q3 is partial:** data stops on 31 Aug 2025, so Q3 (₹13.4M) covers two months and should not be compared with Q1 or Q2 (₹19.7M and ₹19.9M).
- **Sampling effect:** orders per state are near-uniform (5K / 10K tiers) with Karnataka at 20K, so city rankings partly reflect coverage.
- **22 Feb 2025 spike:** about 1,550 orders vs roughly 800 on adjacent days, with 54% from Bengaluru.
- **Food Type tagging is keyword-based:** 656 prawn dishes (₹0.29M, about 0.5% of sales) are tagged Veg. The impact on the 65/35 split is small, but the keyword list (note the "prawan" spelling) should be corrected.
- **Sales means item price** and excludes delivery fees, taxes and discounts.

6. Recommendations

Finding	Recommended action
Basket size varies more than volume (Goa ₹306 vs Tripura ₹229)	Use bundles and free-delivery thresholds in low-AOV states to raise basket value
Non-Veg orders are worth 32% more than Veg	Cross-sell Non-Veg add-ons and combos to Veg-heavy restaurants where relevant
Orders over ₹500 give 23% of sales	Promote family and party combos, especially on weekends
5 chains hold 25% of sales	Negotiate chain-level offers, and support local restaurants to diversify supply
Daily demand is flat (about 3% spread)	Focus on menu, pricing and delivery speed rather than day-specific discounts
Rating stuck at 4.3	Set a 4.5 target and reward high-rated restaurants with visibility

7. Method and workbook

The analysis was built in Microsoft Excel. The 197,430-row table was cleaned and extended with calculated columns (Day, Quarter, Week, Food Type), summarised with Pivot Tables and Pivot Charts, and presented on an interactive dashboard with Month, Category and Restaurant Name slicers. The figures in this report were recomputed directly from the dataset and match the dashboard.

Sheet	Purpose
Swiggy Data	197,430 records, 14 columns
Analysis1	Pivot tables and KPI calculations
Sheet3	Supporting monthly pivot
DASHBOARD	Final interactive dashboard

KPI	Definition
Total Sales	Sum of Price (INR)
Total Orders	Count of Dish Name (rows)
Average Order Value	Total Sales ÷ Total Orders
Average Rating	Mean of Rating
Rating Count	Sum of Rating Count
